

#1 guide:

Start by trimming the wick flush with the upper part of the small wick holder.

When the wicks have been trimmed, then place the 3 sticks in the glass with oil. Allow the sticks to soak up oil for 20-30 min. prior to initial lighting.

After 20-30 min. the sticks are ready - please light.

Watch the oil level and make sure to refill before it runs out of oil. This will extend the life of the wicks.

If adjustment of the wicks is needed, then the easiest way to do so, is by gently "tap" the sticks down on a hard surface. PLEASE remember to use some kind of cover, like an old newspaper or so, since the sticks might leak a little oil when doing so.

#1 guide - continued...

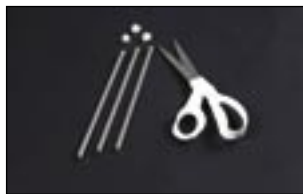

The sticks are burning best, if the wick is in level with the upper part of the small wick holder. Please remember, that the sticks are NOT burning better, if the wicks are pulled up over this level.

The wicks are easily replaced!
Use a very thin steel thread or something similar. Take out the old wick by removing the small wick holder and tighten the steel thread around one end of the wick a few times.

Pull the wick through the stick, from top to bottom. When it is through, then take of the steel thread.

Trim the wicks as in picture 1 and allow the sticks to soak oil before lighting again.

Enjoy your oil lamps...
